

Large-Scale Deep Learning With TensorFlow

Jeff Dean
Google Brain team
g.co/brain

In collaboration with **many** other people at Google

We can now store and perform computation on large datasets

We can now store and perform computation on large datasets

But what we really want is not just raw data,
but computer systems that **understand** this data

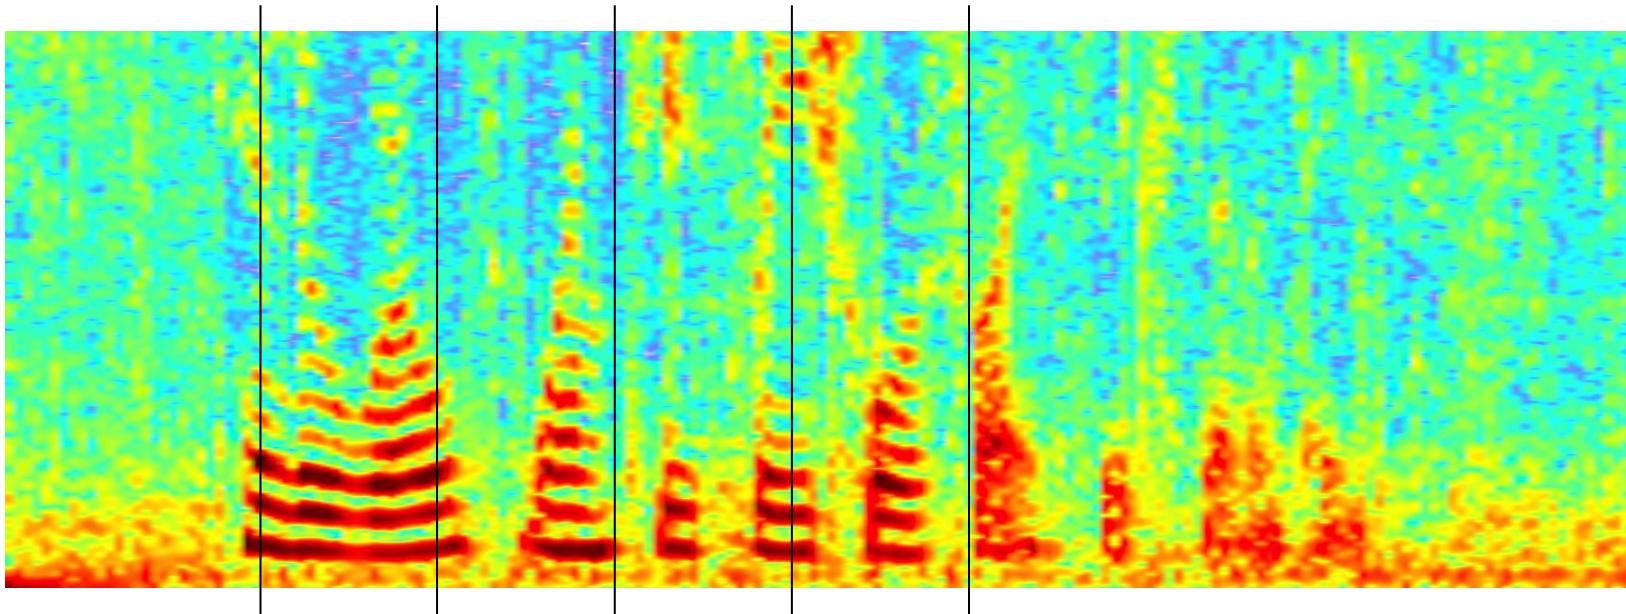

What do I mean by understanding?

What do I mean by understanding?

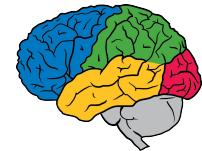

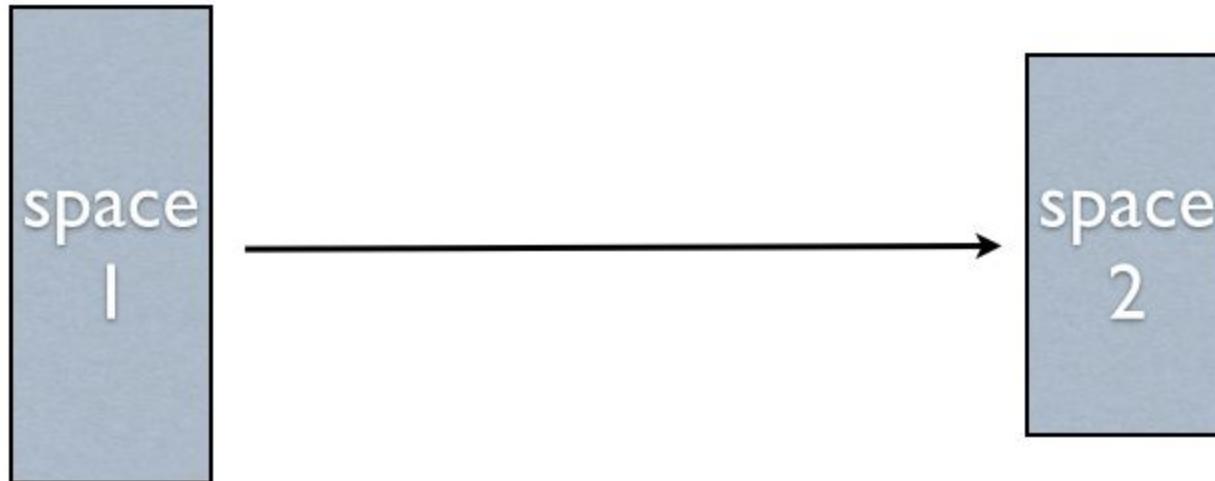

What do I mean by understanding?

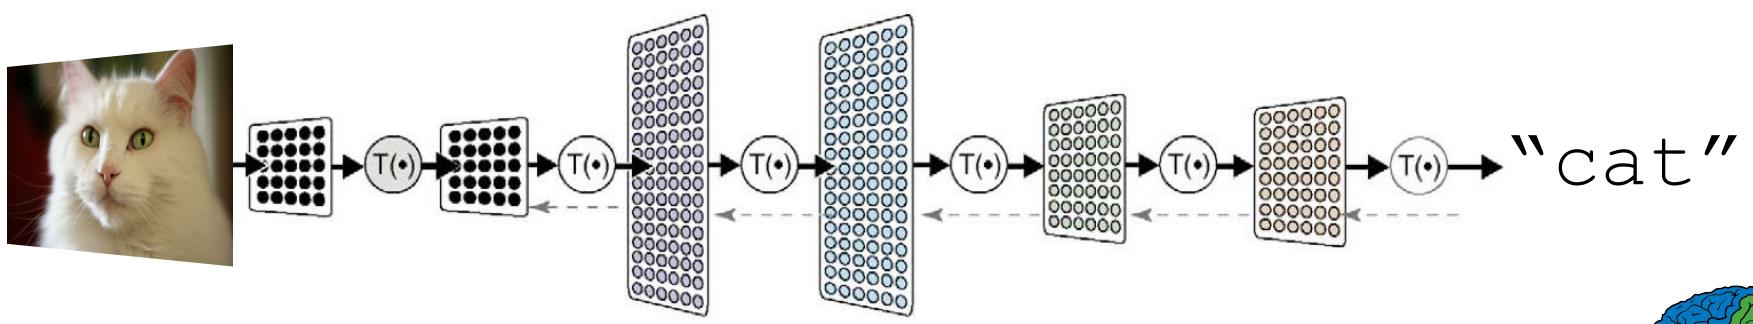

Neural Networks

- Learn a complicated function from data

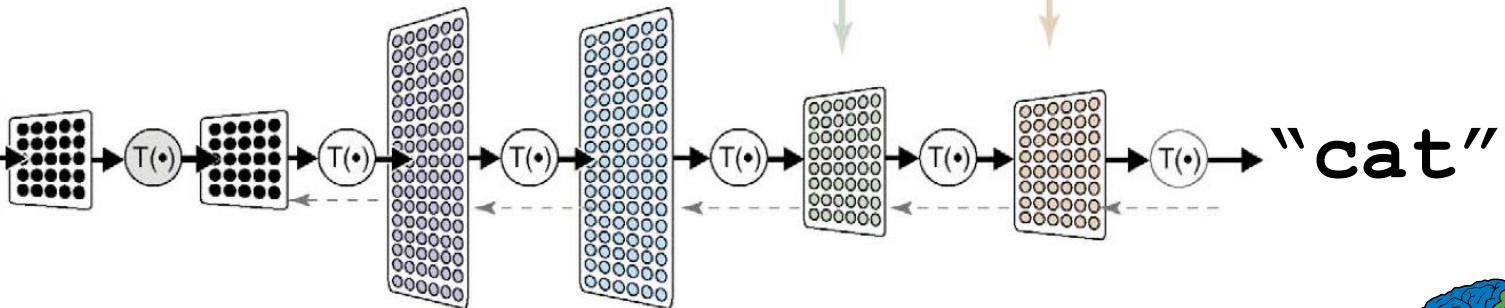

What is Deep Learning?

- A powerful class of machine learning model
- Modern reincarnation of artificial neural networks
- Collection of simple, trainable mathematical functions

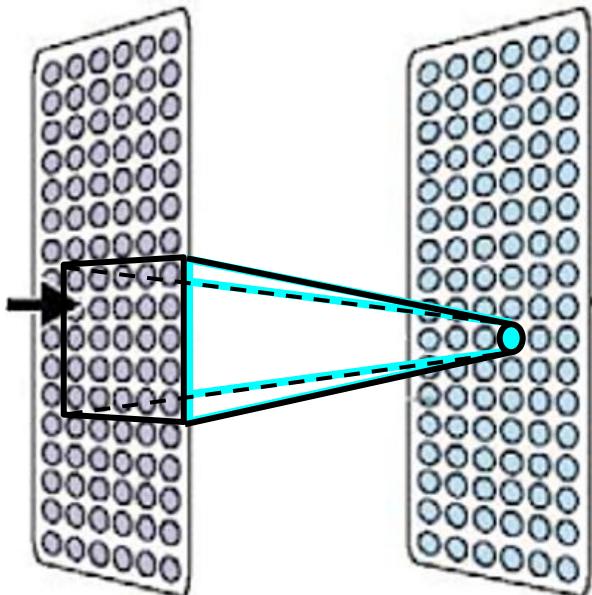

What is Deep Learning?

- Loosely based on (what little) we know about the brain

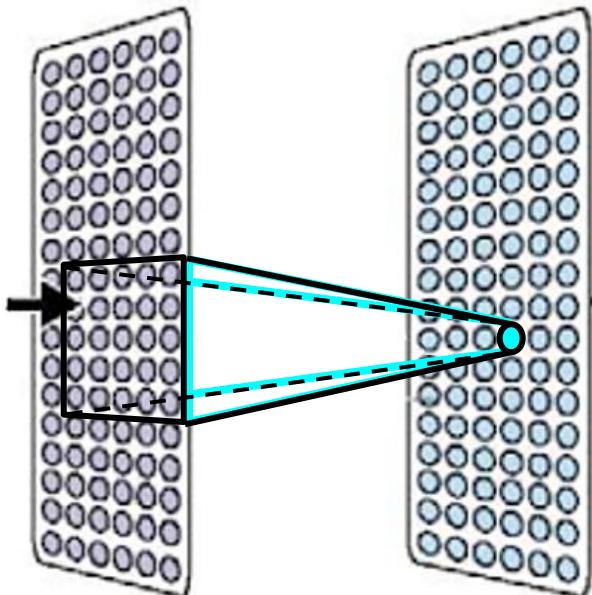

What is Deep Learning?

Commonalities with real brains:

- Each neuron is connected to a small subset of other neurons.
- Based on what it sees, it decides what it wants to say.
- Neurons learn to cooperate to accomplish the task.

What is Deep Learning?

Each neuron implements a relatively simple mathematical function.

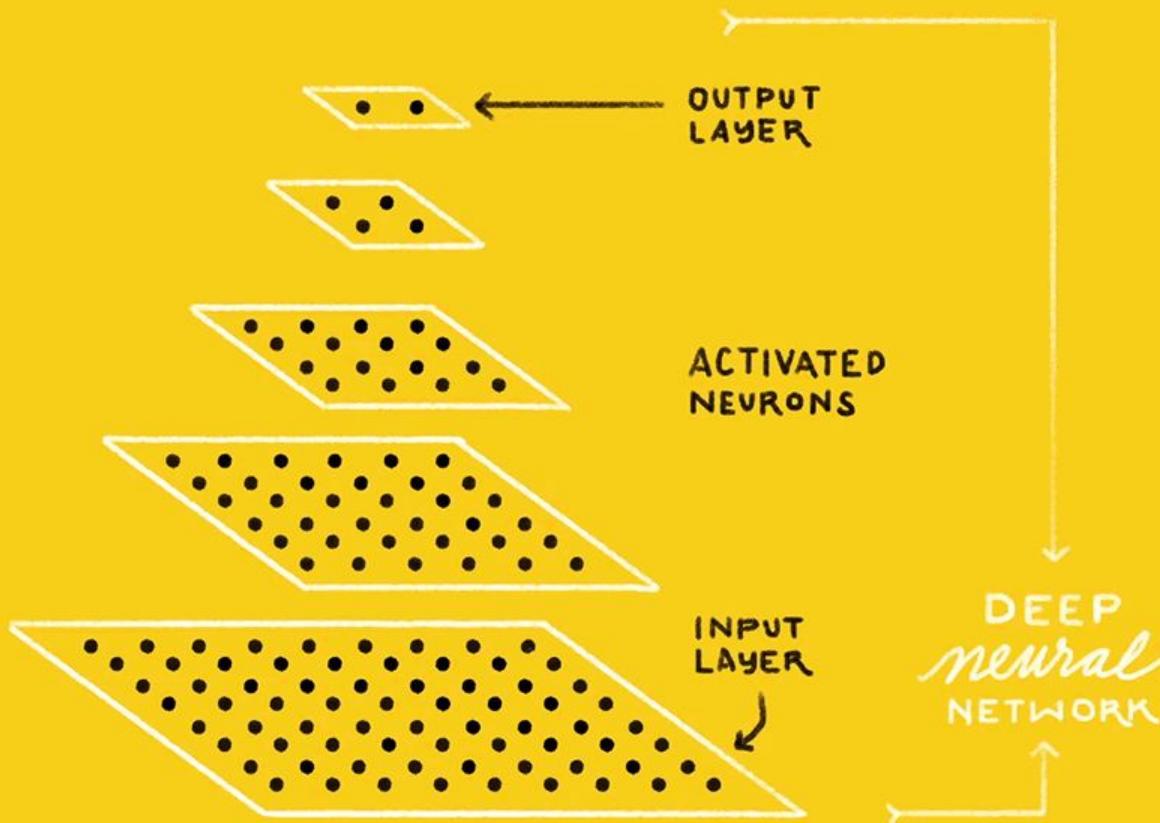

$$y = g(\vec{w} \cdot \vec{x} + b)$$

But the composition of 10^6 - 10^9 such functions is surprisingly powerful.

IS THIS A
CAT or DOG?

CAT DOG

Important Property of Neural Networks

Results get better with

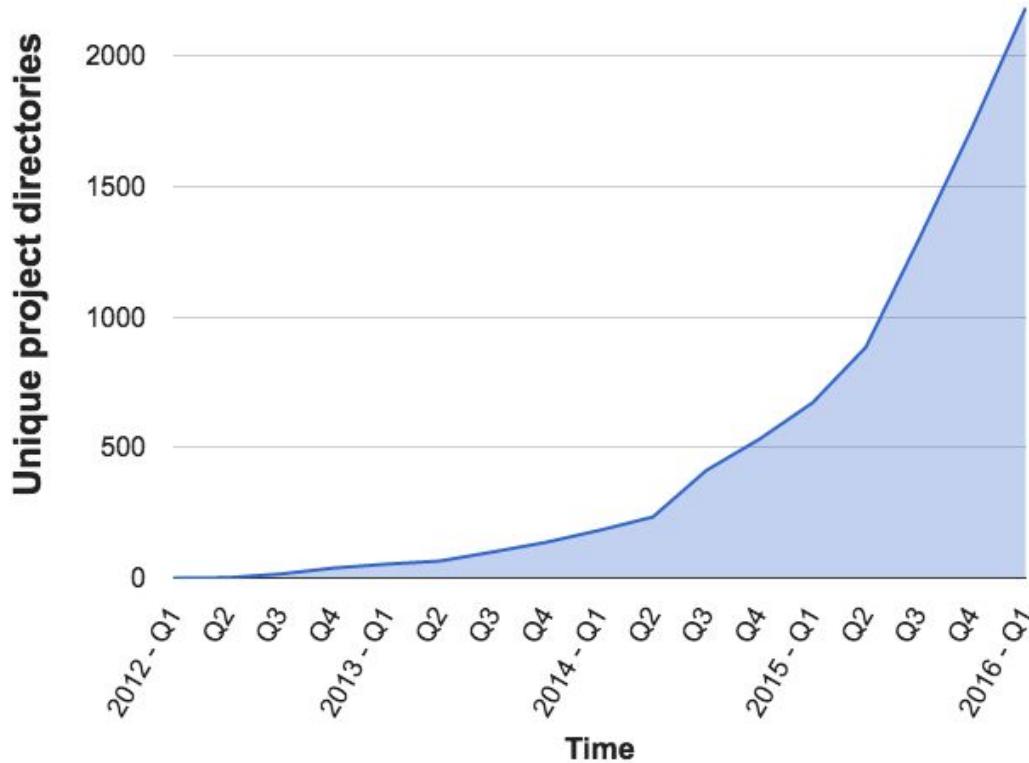

**more data +
bigger models +
more computation**

(Better algorithms, new insights and improved
techniques always help, too!)

Growing Use of Deep Learning at Google

of directories containing model description files

Across many products/areas:

Android
Apps
drug discovery
Gmail
Image understanding
Maps
Natural language understanding
Photos
Robotics research
Speech
Translation
YouTube
... many others ...

<http://tensorflow.org/>

and

<https://github.com/tensorflow/tensorflow>

Open, standard software for
general machine learning

Great for Deep Learning in
particular

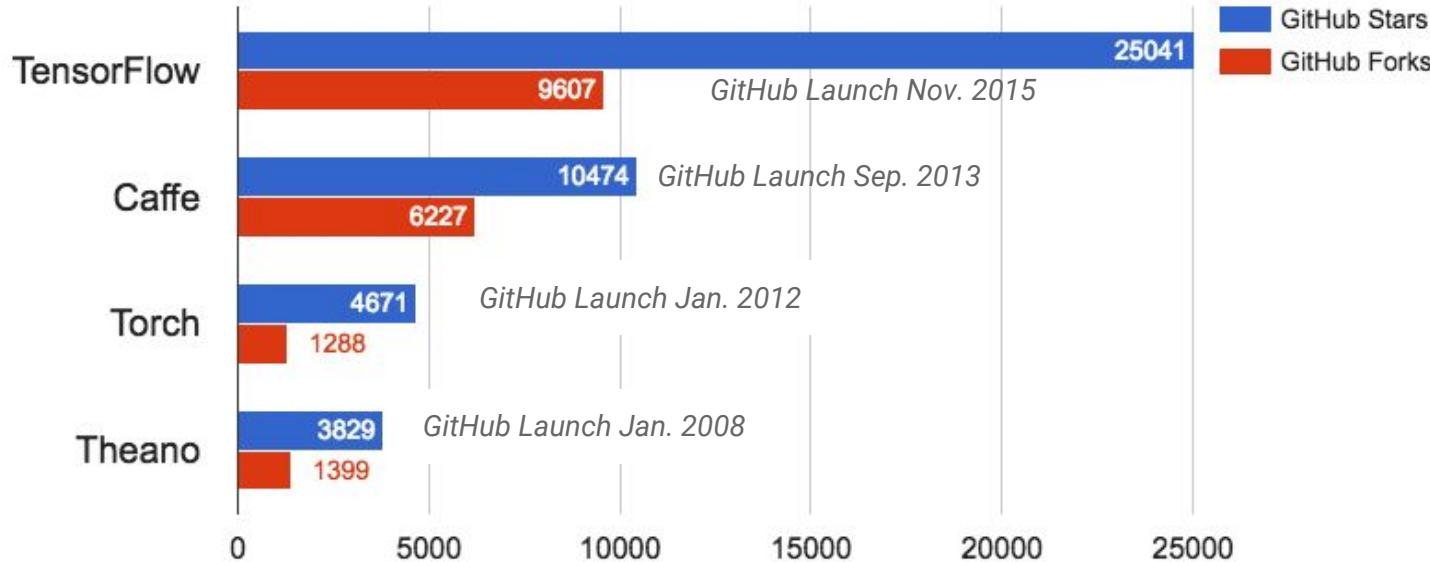

First released Nov 2015

Apache 2.0 license

Strong External Adoption

Adoption of Deep Learning Tools on GitHub

50,000+ binary installs in 72 hours, 500,000+ since Nov, 2015

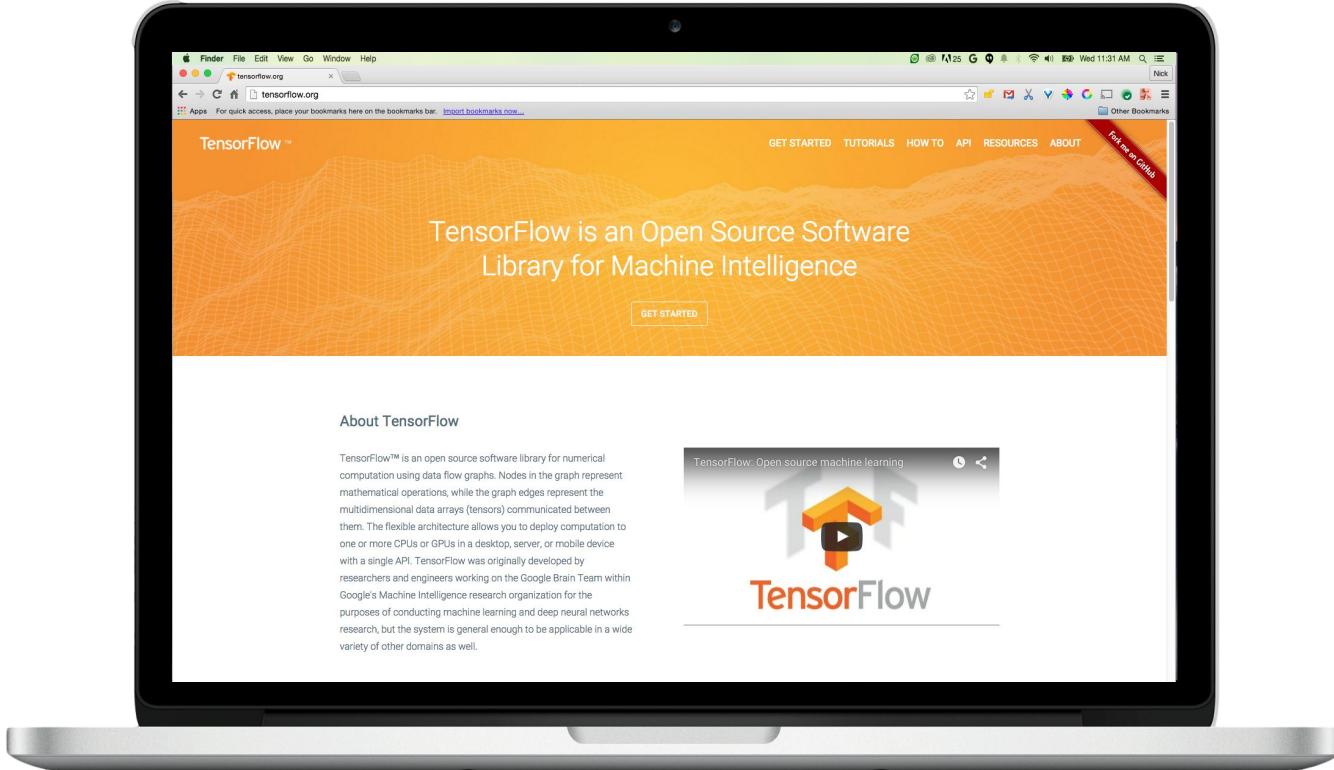

Most forks of any GitHub repo in 2015, despite only being available starting in Nov, 2015

(source: <http://donnemartin.com/viz/pages/2015>)

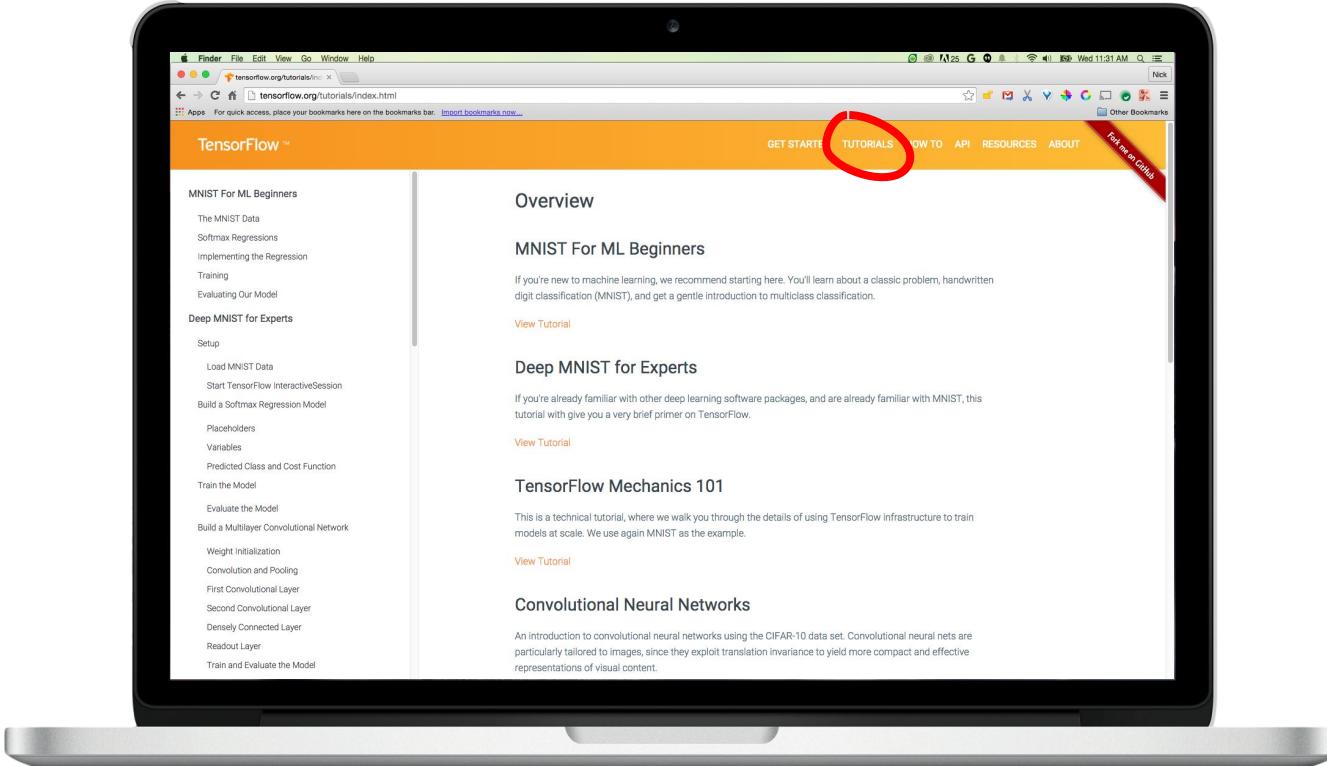

Motivations

- DistBelief (our 1st system) was scalable and good for production deployment, but not as flexible as we wanted for research purposes
- Better understanding of problem space allowed us to make some dramatic simplifications
- Define a standard way of expressing machine learning ideas and computations
- Short circuit the MapReduce/Hadoop inefficiency

<http://tensorflow.org/>

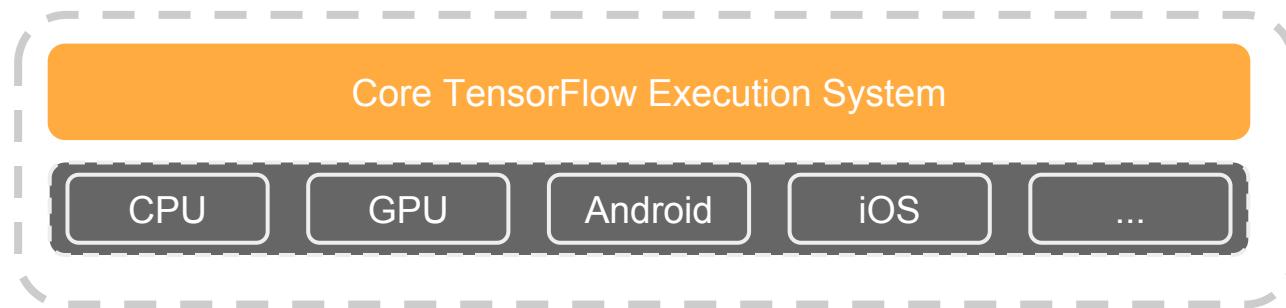

http://tensorflow.org/

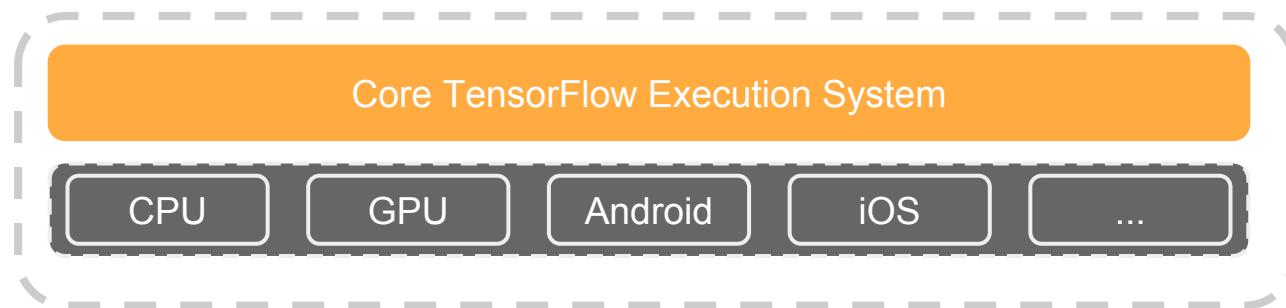

TensorFlow: Expressing High-Level ML Computations

- Core in C++
 - Very low overhead

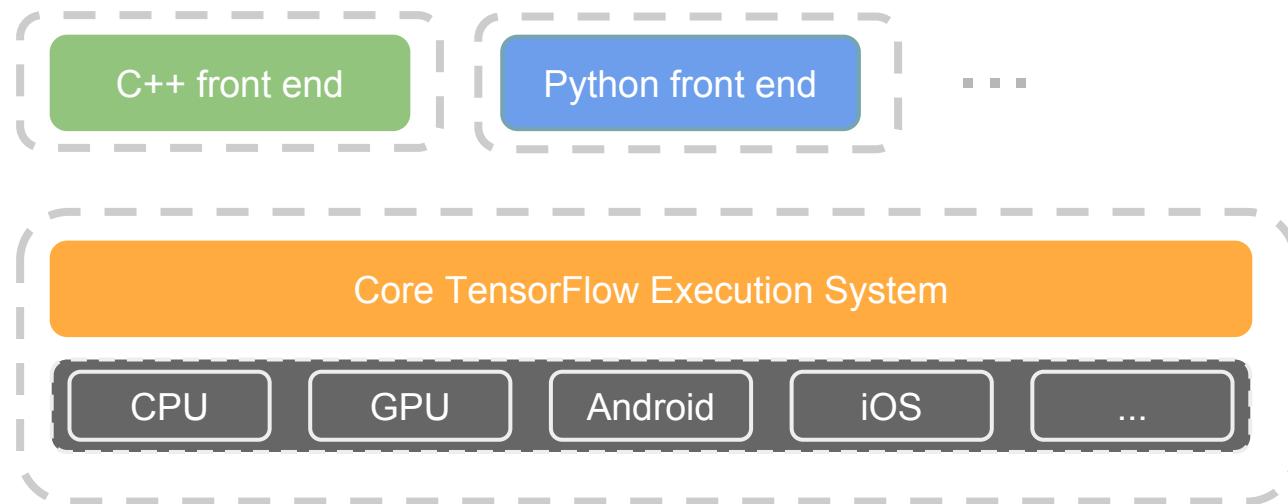

TensorFlow: Expressing High-Level ML Computations

- Core in C++
 - Very low overhead
- Different front ends for specifying/driving the computation
 - Python and C++ today, easy to add more

TensorFlow: Expressing High-Level ML Computations

- Core in C++
 - Very low overhead
- Different front ends for specifying/driving the computation
 - Python and C++ today, easy to add more

Example TensorFlow fragment

- Build a graph computing a neural net inference.

```
import tensorflow as tf
from tensorflow.examples.tutorials.mnist import input_data

mnist = input_data.read_data_sets('MNIST_data', one_hot=True)
x = tf.placeholder("float", shape=[None, 784])
w = tf.Variable(tf.zeros([784,10]))
b = tf.Variable(tf.zeros([10]))
y = tf.nn.softmax(tf.matmul(x, w) + b)
```

Python API for Machine Learning

- Automatically add ops to calculate symbolic gradients of variables w.r.t. loss function.
- Apply these gradients with an optimization algorithm

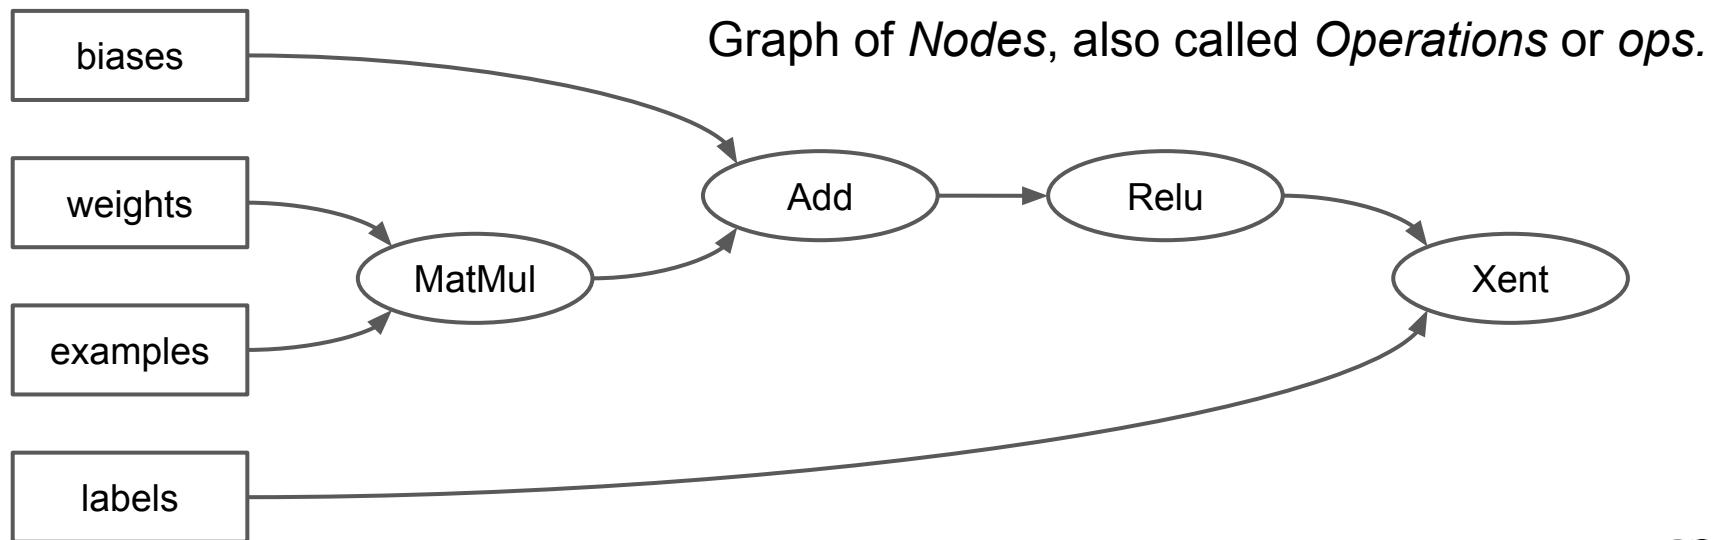

```
y_ = tf.placeholder(tf.float32, [None, 10])
cross_entropy = -tf.reduce_sum(y_*tf.log(y))
opt = tf.train.GradientDescentOptimizer(0.01)
train_op = opt.minimize(cross_entropy)
```

Python API for Machine Learning

- Launch the graph and run the training ops in a loop

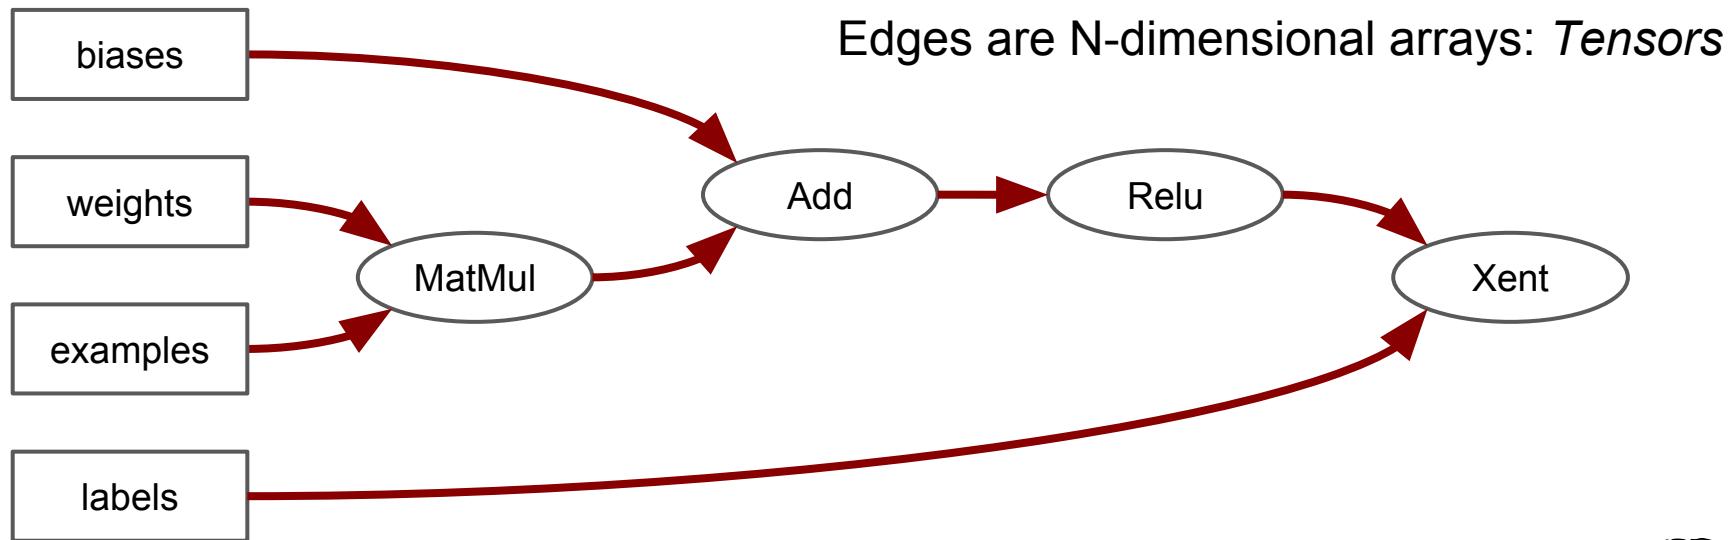

```
init = tf.initialize_all_variables()
sess = tf.Session()
sess.run(init)
for i in range(1000):
    batch_xs, batch_ys = mnist.train.next_batch(100)
    sess.run(train_step, feed_dict={x: batch_xs, y_: batch_ys})
```

Computation is a dataflow graph

Computation is a dataflow graph

with tensors

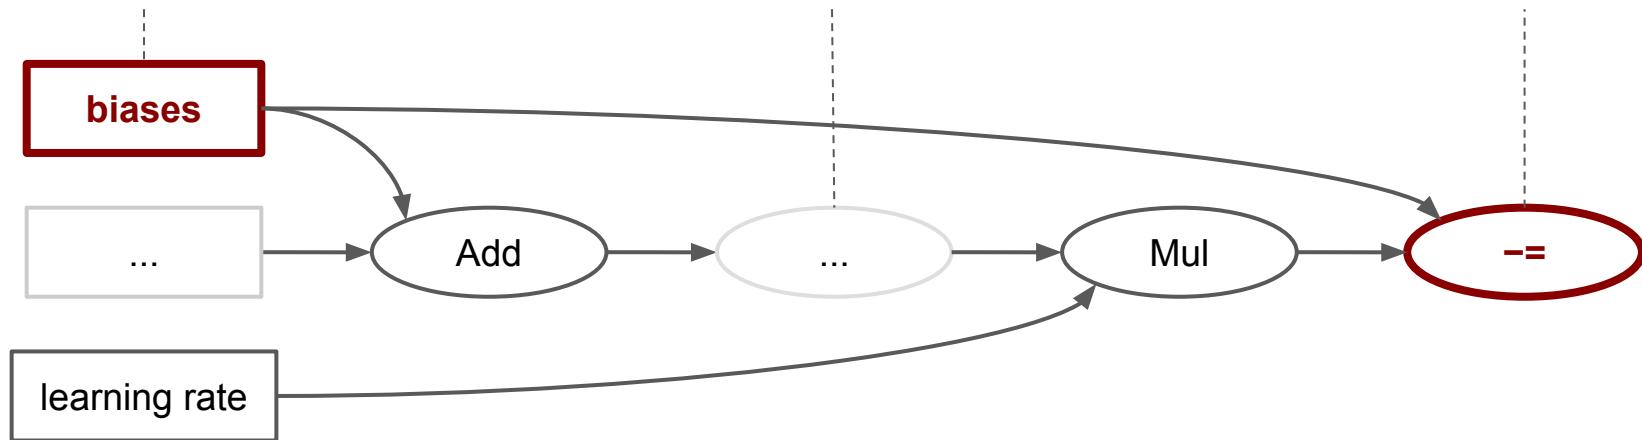

Computation is a dataflow graph

with state

'Biases' is a variable

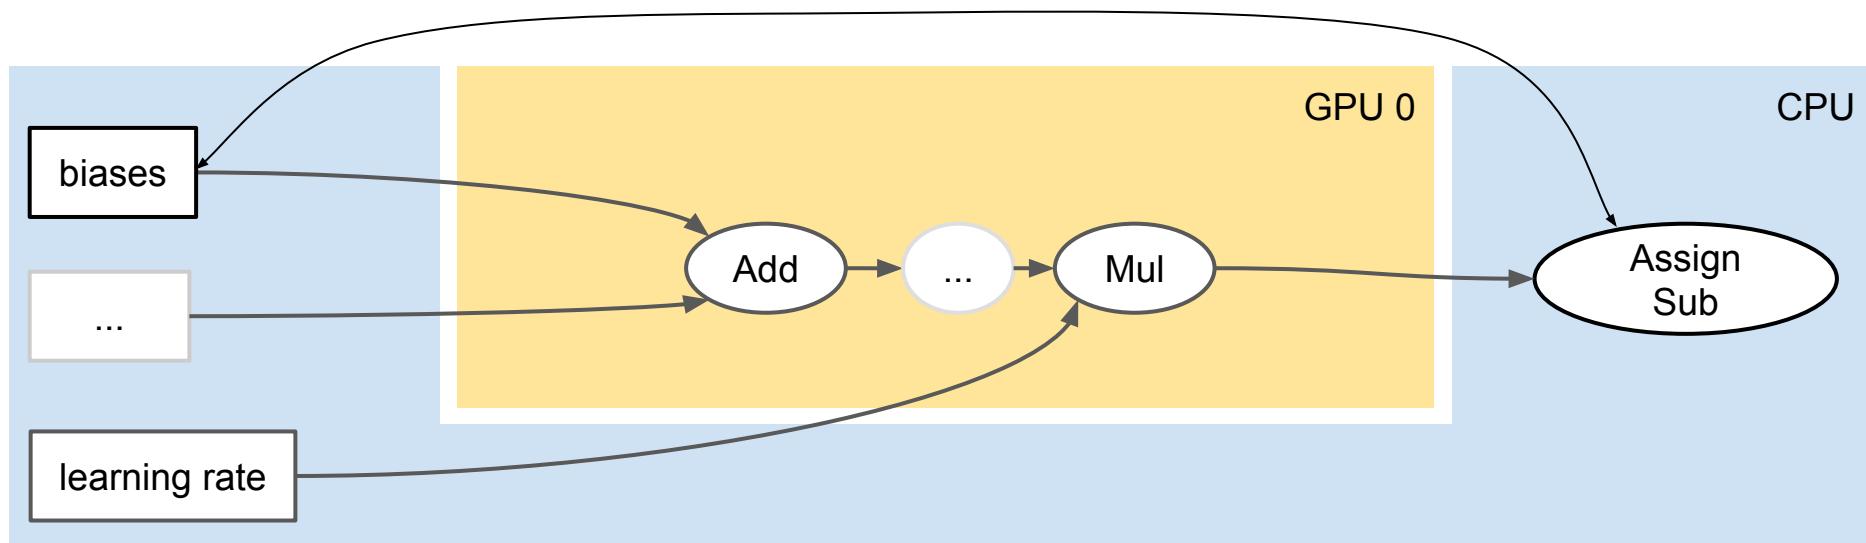

Some ops compute gradients

`-=` updates biases

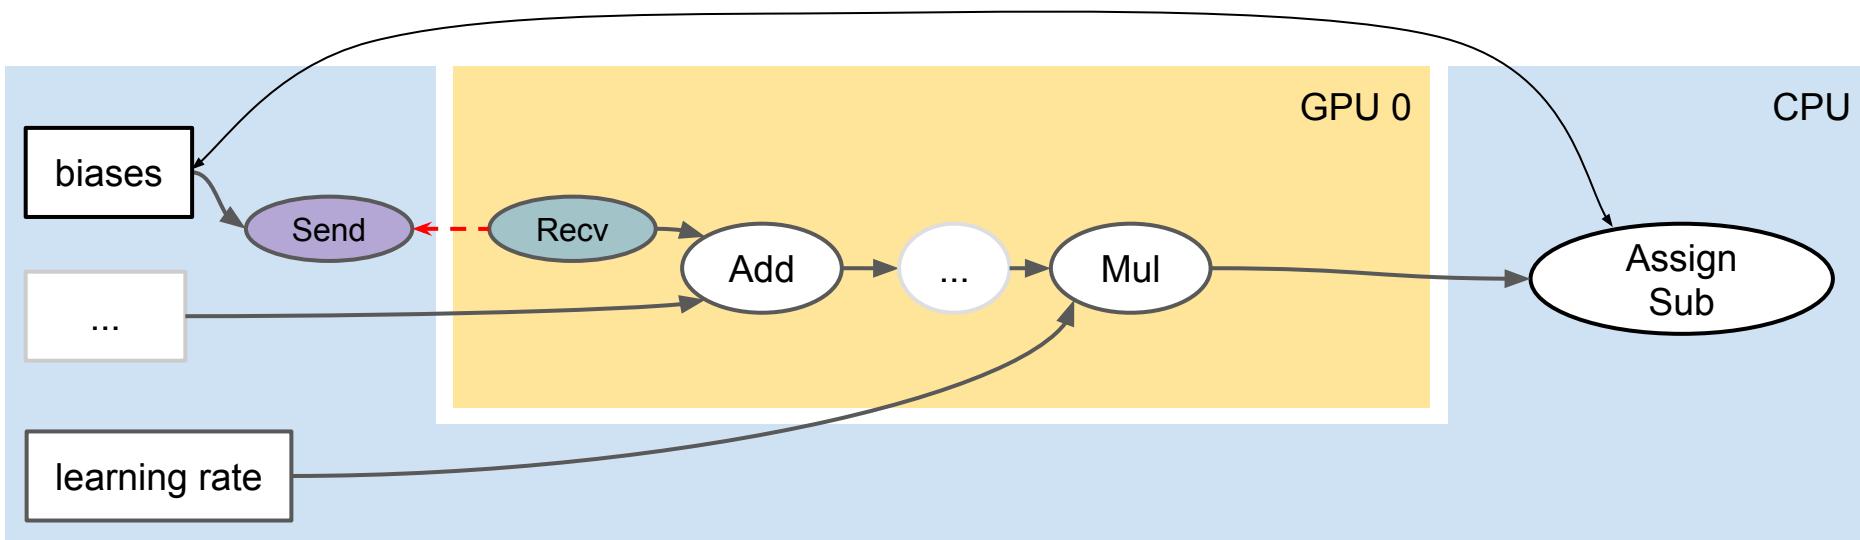

Computation is a dataflow graph

distributed

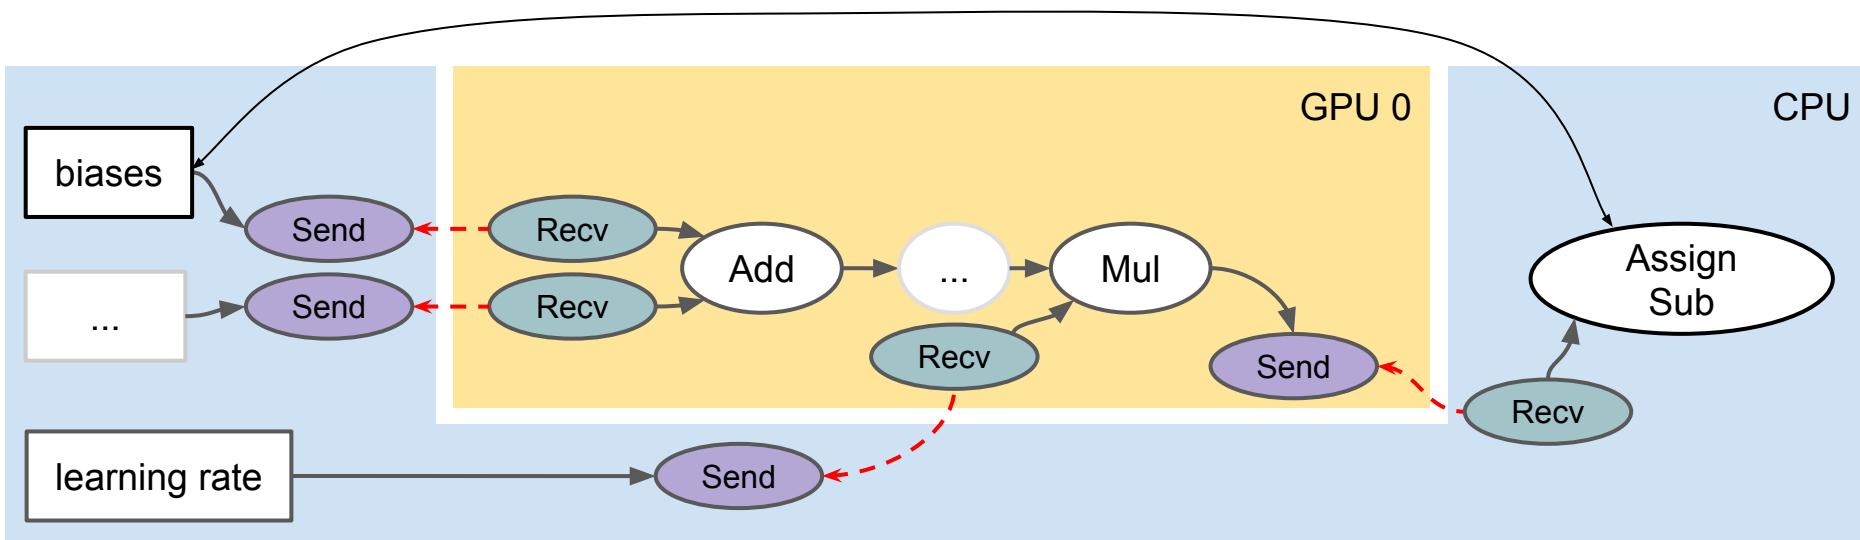

Assign Devices to Ops

- TensorFlow inserts *Send/Recv* Ops to transport tensors across devices
- Recv* ops pull data from *Send* ops

Assign Devices to Ops

- TensorFlow inserts *Send/Recv* Ops to transport tensors across devices
- Recv* ops pull data from *Send* ops

Automatically Runs on Variety of Platforms

“Seeing” Go

Google's AI just cracked the game that supposedly no computer could beat

By [Mike Murphy](#) | January 27, 2016

The BBC News website features a prominent headline: "Google achieves AI 'breakthrough' at Go". Below the headline is a sub-headline: "An artificial intelligence program developed by Google beats Europe's top player at the ancient Chinese game of Go, about a decade earlier than expected." The article was published on January 27, 2016, in the Technology section. The BBC navigation bar includes links for News, Sport, Weather, iPlayer, TV, Radio, More, Search, and Find local news.

Kiyoshi Ota)

Only started to encroach on activities we previously thought only the brilliant human brain could handle. In 1997, a supercomputer beat Grand Master Garry Kasparov at chess, and in 2011 IBM's Watson beat former human winners at the quiz game *Jeopardy*. But the ancient board game Go has long been one of the major goals of artificial intelligence research. It's understood to be one of the most difficult games for computers to handle due to the sheer number of possible moves a player can make at any given point. Until now, that is.

How Can You Get Started with Machine Learning?

Four ways, with varying complexity:

- (1) Use a Cloud-based API (Vision, Speech, etc.)
- (2) Run your own pretrained model
- (3) Use an existing model architecture, and
retrain it or fine tune on your dataset
- (4) Develop your own machine learning models
for new problems

More
flexible,
but more
effort
required

(1) Use Cloud-based APIs

GOOGLE TRANSLATE API

Dynamically translate between thousands of available language pairs

cloud.google.com/translate

CLOUD SPEECH API ALPHA

Speech to text conversion powered by machine learning

cloud.google.com/speech

CLOUD VISION API

Derive insight from images with our powerful Cloud Vision API

cloud.google.com/vision

CLOUD TEXT API ALPHA

Use Cloud Text API for sentiment analysis and entity recognition in a piece of text.

Train the Model

- Evaluate the Model
- Build a Multilayer Convolutional Network

Weight Initialization

Usage with Python API

`classify_image.py` downloads the trained model from `tensorflow.org` when the program is run for the first time. You'll need about 200M of free space available on your hard disk.

The following instructions assume you installed TensorFlow from a PIP package and that your terminal resides in the TensorFlow root directory.

```
cd tensorflow/models/image/imagenet  
python classify_image.py
```

The above command will classify a supplied image of a panda bear.

If the model runs correctly, the script will produce the following output:

```
giant panda, panda, panda bear, coon bear, Ailuropoda melanoleuca (score = 0.88493)  
indri, indris, Indri indri, Indri brevicaudatus (score = 0.00878)  
lesser panda, red panda, panda, bear cat, cat bear, Ailurus fulgens (score = 0.00317)  
custard apple (score = 0.00149)  
earthstar (score = 0.00127)
```

For training your own models (3 & 4), two choices:

Run open-source release on your own physical machines or virtual machines in a cloud hosting environment

or

CLOUD MACHINE LEARNING ALPHA
Machine Learning on any data, of any size

How to Retrain Inception's Final Layer for New Categories

Modern object recognition models have millions of parameters and can take weeks to fully train. Transfer learning is a technique that shortcuts a lot of this work by taking a fully-trained model for a set of categories like ImageNet, and retrains from the existing weights for new classes. In this example we'll be retraining the final layer from scratch, while leaving all the others untouched. For more information on the approach you can see [this paper on Decaf](#).

Though it's not as good as a full training run, this is surprisingly effective for many applications, and can be run in as little as thirty minutes on a laptop, without requiring a GPU. This tutorial will show you how to run the example script on your own images, and will explain some of the options you have to help control the training process.

Overview

TensorFlow is a programming system in which you represent computations as graphs. Nodes in the graph are called `ops` (short for operations). An op takes zero or more `Tensors`, performs some computation, and produces zero or more `Tensors`. A `Tensor` is a typed multi-dimensional array. For example, you can represent a mini-batch of images as a 4-D array of floating point numbers with dimensions `[batch, height, width, channels]`.

A TensorFlow graph is a description of computations. To compute anything, a graph must be launched in a `Session`. A `Session` places the graph `ops` onto `Devices`, such as CPUs or GPUs, and provides methods to execute them. These methods return tensors produced by ops as `numpy ndarray` objects in Python, and as `tensorflow::Tensor` instances in C and C++.

The computation graph

TensorFlow programs are usually structured into a construction phase, that assembles a graph, and an execution phase that uses a session to execute ops in the graph.

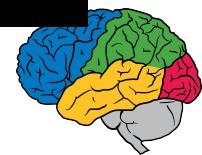

Example: Combining Vision with Robotics

“Deep Learning for Robots: Learning from Large-Scale Interaction”, Google Research Blog, March, 2016

“Learning Hand-Eye Coordination for Robotic Grasping with Deep Learning and Large-Scale Data Collection”,

<https://www.youtube.com/watch?v=iaF43Ze1oel>

What Does the Future Hold?

Deep learning usage will continue to grow and accelerate:

- Across more and more fields and problems:
 - robotics, self-driving vehicles, ...
 - health care
 - video understanding
 - dialogue systems
 - personal assistance
 - ...

Conclusions

Deep neural networks are making significant strides in understanding:

In speech, vision, language, search, ...

If you're not considering how to use deep neural nets to solve your vision or understanding problems, **you almost certainly should be**
